The Physician Orders Management Application (POMA) was created to manage the standing physician orders and to assist in integrating them into a patient's overall medical records. Paper-based physician orders and charts can quickly become cumbersome and expensive to maintain and control. A solid electronic physician orders system such as POMA streamlines the patient care process, and creates a standardized system that caregivers, administration, and support staff can all follow. Confusion is eliminated, errors are minimized, efficiency is increased, and costs are controlled.

Eliminate Medication Errors: As with all of the HealthDox system solutions, POMA features an easy-to-use interface, fast and efficient searching capability, and the ability to customize to your specific record management and storage needs. All treatments, medication instructions, and delegated tasks are recorded and stored electronically, eliminating legibility concerns and serving as a double-check against medication errors.

Increase Efficiency: POMA has several features to assist physician efficiency, such as standardized templates and pre-population of patient data, online form fill and automated charting, and portability through tablets and other wireless devices. These features allow physicians to spend less time on mundane and distracting tasks, and spend more time on the important issue— quality care for all patients.

Eliminate Order Set Inventory Cost: With the adoption of POMA, healthcare organizations eliminate huge printing and order set inventory management sets. Centralized electronic order sets are available to all physicians at all facilities.

Standardize Patient Care: POMA standardizes patient care by making the same order sets available across the entire organization. To maintain consistency of care, physicians are notified about changes to existing orders and any deletion or addition of orders.

Integration with Hospital Systems: POMA can manage corresponding documents as well as physician orders— items such as consent forms, evidence documents, and procedures. POMA can integrate with, and export to, other applications as needed to provide comprehensive, reviewable records and allow seamless transfer between care providers within a hospital system.

Collaborative Review Process: POMA schedules physician and nursing committee reviews of physician orders and sends corresponding reminders. POMA provides a collaboration platform for physicians and order set developers can review, comment and update physician orders based on changing regulations.

Security: Secure access is an integral part of POMA. POMA implements extensive role based security model for protecting physician orders. Administrative functions are restricted to system administrators. Enhanced security features maintain your records within regulatory standards, and allow for stand-alone or integrated authorization.

POMA is a powerful tool for maintaining a smooth and error-free healthcare entity. If you are looking to streamline your management of physician orders, contact us for a demonstration of how you can put the power of POMA to work for you.
